

Environmental Performance System

EPS

Professional management of your environmental issues

The strive for sustainable growth as well as reducing global warming and the need to control down-side risks is forcing companies to address developments in Corporate Social Responsibility and produce Triple Bottom Line reports. DNV Software offers EPS to help companies better monitor their environmental performance.

DNV Software's EPS software will help you measure your environmental performance including your CO2 footprint. EPS offers a web-based reporting tool that supports the Global Reporting Initiative standards and ISO 14001.

EPS takes advantage of both DNV Software's experience producing commercial software and DNVs environmental consultants knowledge.

Once you have entered data on resource usage from your company records, EPS will calculate emissions using formulas verified by DNV. By comparing results from EPS against your own acceptance criteria you can establish where improvements are required.

Benefits

- Supports international standards including Global Reporting Initiative standards and ISO 14001
- Produces a total overview of your environmental profile
- Compatible with Microsoft Office applications
- Flexible user friendly web based tool allows global reporting from all sites using a single database
- Justifiable results based on best industry practices and formulas verified by DNV
- Supports emerging requirements for triple bottom line reporting and emission trading schemes

Customer testimonial

“We needed to improve our knowledge about total energy consumption and waste management from the operations. To provide current and accurate data about where, how and how much our operations affected the environment, we needed better tools. Having used EPS for these purposes, we now have a complete overview at all times.”

“We have standardised the registration formats and have current and accurate data for analysis and decision support at all times. Without this database, our data would have been of lesser quality and it would have taken a lot of time and resource to comply with the new regulations related to environmental public reporting.”

Data Input

Users from all over the world can enter data in a single web-based system so that a full picture of your environmental performance world-wide is established. By allowing input from geographically dispersed staff precise physical values can be entered, ensuring accurate results. Automated registrations from other operational systems via XML, can also be offered as an optional service.

Pre-defined industry specific templates can be used for data entry. For more specialised use DNV can produce a database designed especially for you.

Calculations

Using calculations based on years of knowledge from DNV’s environmental consulting group a full measure of your environmental performance can quickly and easily be produced.

Industry sectors and availability

The solution is generic and configurable for all industry sectors, land-based as well as maritime. EPS is currently available in English and Norwegian language versions.

Why should you improve management of your company’s environmental performance?

- Awareness and attention on environmental issues often leads to improved quality and performance in other areas.
- Positive and convincing environmental management is an important tool in the marketing process complete overview at all times.
- Authorities and other stakeholders are increasingly demanding improved environmental management.
- Form correct basis for emission trading schemes.
